# Distributed Resource Management Application API Version 2.2 (DRMAA) C Language Binding

## Status of This Document

OGF Proposed Recommendation (GFD-R-P.230)

## Obsoletes

This document obsoletes GFD-R-P.198 [2].

## Abstract

This document describes the C language binding for the *Distributed Resource Management Application API Version 2 (DRMAA)*. The intended audience for this specification are DRMAA implementors.

# **Notational Conventions**

In this document, C language elements and definitions are represented in a fixed-width font.

The key words "MUST" "MUST NOT", "REQUIRED", "SHALL", "SHALL NOT", "SHOULD", "SHOULD NOT", "RECOMMENDED", "MAY", and "OPTIONAL" are to be interpreted as described in RFC 2119 [1].

# 1 Introduction

The Distributed Resource Management Application API Version 2 (DRMAA) specification defines an interface for tightly coupled, but still portable access to the majority of DRM systems. The scope is limited to job submission, job control, reservation management, and retrieval of job and machine monitoring information.

The DRMAA root specification [3] describes the abstract API concepts and the behavioral rules of a compliant implementation, while this document standardizes the representation of API concepts in the C programming language.

# 2 General Design

The mapping of DRMAA root specification concepts to C follows a set of design principles. Implementation-specific extensions of the DRMAA C API SHOULD follow these conventions:

- Namespacing of the DRMAA API, as demanded by by the root specification, is realized with the drmaa2\_ prefix for lower- and upper-case identifiers.
- In identifier naming, "job" is shortened as "j" and "reservation" is shortened as "r" for improved readability.
- The root specification demands a consistent parameter passing strategy for non-scalar values. All such values are passed as call-by-reference parameter in the C binding.
- Structs and enums are typedef'ed for better readability.
- Struct types have an \_s suffix with their name. Structures with a non-standardized layout are defined as forward references for the DRMAA library implementation.
- Functions with IDL return type void have drmaa2\_error as return type.
- The IDL boolean type maps to the drmaa2\_bool type.
- The IDL long type maps to long long in C. One exception is the exitStatus variable, which is defined as int in order to provide a more natural mapping to existing operating system interfaces.
- The IDL string type is mapped in two different ways. Attributes and parameters with string values typically created by the implementation are mapped to the drmaa2\_string type. The application frees such memory by calling the newly introduced function drmaa2\_string\_free. All other string parameters are mapped to the const char \* type. Implementations MUST accept calls to drmaa2\_string\_free for all string pointers, regardless of their type.
- The language binding defines one UNSET macro per utilized C data type (DRMAA2\_UNSET\_\*).
- The language binding defines separate UNSET members for each enumeration, to avoid C compiler complains when using a common UNSET value for enumerations. Their values MUST all equal to DRMAA2\_UNSET\_ENUM, so that both variants can be used.
- All numerical types are signed, in order to support -1 as numerical UNSET value.
- Both AbsoluteTime and TimeAmount map directly to time\_t. RFC 822 support as mandated by the root specification is given by the %z formatter for sprintf.

• Multiple output parameters are realized by declaring all but one of them as pointer variable. For this reason, the substate parameter in drmaa2\_j\_get\_state SHALL be interpreted as pointer to a string variable created by the DRMAA library.

- The const declarator is used to mark parameters declared as readonly in the root specification.
- The two string list types in DRMAA, ordered and unordered, are mapped to one ordered list with the DRMAA2\_STRING\_LIST type.
- The any member for job sub-state information is defined as drmaa2\_string to achieve application portability.

Application-created structs should be allocated by the additional support methods (such as drmaa2\_jinfo\_create) to realize the necessary initialization to UNSET. This SHOULD be properly documented by the implementation.

The following structures are only used in result values. For this reason, the according allocation functions are not part of the API:

- drmaa2\_string
- drmaa2\_slotinfo
- drmaa2\_rinfo
- drmaa2\_notification
- drmaa2\_queueinfo
- drmaa2\_version
- drmaa2\_machineinfo

The interface membership of a function is sometimes expressed by an additional prefix, as shown in Table 1.

DRMAA interface	C binding prefix
DrmaaReflective	drmaa2_
SessionManager	drmaa2_
JobSession	drmaa2_jsession_
ReservationSession	drmaa2_rsession_
MonitoringSession	drmaa2_msession_
Reservation	drmaa2_r_
Job	drmaa2_j_
JobArray	drmaa2_jarray_
JobTemplate	drmaa2_jtemplate_
ReservationTemplate	drmaa2_rtemplate_

Table 1: Mapping of DRMAA interface name to C method prefix

The C binding specifies the function pointer type drmaa2\_callback for a notification callback function. This represents the DrmaaCallback interface from the root specification. The new constant value DRMAA2\_UNSET\_CALLBACK can be used by the application for the de-registration of callback functions.

## 2.1 Error Handling

The list of exceptions in the DRMAA root specification is mapped to the new enumeration drmaa2\_error. The enumeration member DRMAA2\_LASTERROR is intended to ensure application portability while allowing additional implementation-specific error codes. It MUST always be the enumeration member with the highest value.

The language binding adds two new functions for fetching error number and error message of the last error that occurred: drmaa2\_lasterror and drmaa2\_lasterror\_text. These functions MUST operate in a thread-safe manner, meaning that both error informations are managed per application thread by the DRMAA implementation.

#### 2.2 Resource Limits

The DRMAA2 root specification demands the definition of a set of string constants, declared in the header file:

```
extern const char *const DRMAA2_CORE_FILE_SIZE;
extern const char *const DRMAA2_CPU_TIME;
extern const char *const DRMAA2_DATA_SIZE;
extern const char *const DRMAA2_FILE_SIZE;
extern const char *const DRMAA2_OPEN_FILES;
extern const char *const DRMAA2_STACK_SIZE;
extern const char *const DRMAA2_VIRTUAL_MEMORY;
extern const char *const DRMAA2_WALLCLOCK_TIME;
The implementation part MUST initialize these variables as follows:
const char *const DRMAA2_CORE_FILE_SIZE = "CORE_FILE_SIZE";
const char *const DRMAA2_CPU_TIME = "DRMAA2_CPU_TIME";
const char *const DRMAA2_DATA_SIZE = "DRMAA2_DATA_SIZE";
const char *const DRMAA2_FILE_SIZE = "DRMAA2_FILE_SIZE";
const char *const DRMAA2_OPEN_FILES = "DRMAA2_OPEN_FILES";
const char *const DRMAA2_STACK_SIZE = "DRMAA2_STACK_SIZE";
const char *const DRMAA2_VIRTUAL_MEMORY = "DRMAA2_VIRTUAL_MEMORY";
const char *const DRMAA2_WALLCLOCK_TIME = "DRMAA2_WALLCLOCK_TIME";
```

### 2.3 Lists and Dictionaries

The C language binding adds generic support functions for the collection data types used by the root specification. The newly defined drmaa2\_lasterror and drmaa2\_lasterror\_text functions MUST return according error information for these operations.

Both drmaa2\_list\_create and drmaa2\_dict\_create have an optional parameter callback. It allows the application or the implementation to store a callback pointer to an element cleanup function. It MUST be allowed for the application to provide DRMAA2\_UNSET\_CALLBACK instead of a valid callback pointer. The implementation MUST provide a default callback implementation for all list and dictionary types. This can be used by both the application and the implementation itself.

The following list operations are defined:

drmaa2\_list\_create: Creates a new list instance for the specified type of items. Returns a pointer to the list or NULL on error.

- drmaa2\_list\_free: Frees the list and the contained members. If a callback function was provided on list creation, it SHALL be called once per list item.
- drmaa2\_list\_get: Gets the list element at the indicated position. The element index starts at zero. If the index is invalid, the function returns NULL.
- drmaa2\_list\_add: Adds a new item at the end of the list and returns a success indication. The list MUST contain only the provided pointer, not a deep copy of the provided data structure.
- drmaa2\_list\_del: Removes the list element at the indicated position and returns a success indication. If a callback function was provided on list creation, it SHALL be called before this function returns.
- drmaa2\_list\_size: Returns the number of elements in the list. If the list is empty, then the function returns 0, which SHALL NOT be treated as an error case.
- Similarly, a set of new functions for dictionary handling is introduced:
- drmaa2\_dict\_create: Creates a new dictionary instance. Returns a pointer to the dictionary or NULL on error.
- drmaa2\_dict\_free: Frees the dictionary and the contained members. If a callback function was provided on dictionary creation, it SHALL be called once per dictionary entry.
- drmaa2\_dict\_has: Returns a boolean indication if the given key exists in the dictionary. On error, the function SHALL return FALSE.
- drmaa2\_dict\_get: Gets the dictionary value for the specified key. If the key is invalid, the function returns NULL.
- drmaa2\_dict\_del: Removes the dictionary entry with the given key and returns a success indication. If a callback function was provided on dictionary creation, it SHALL be called before this function returns.
- drmaa2\_dict\_set: Sets the specified dictionary key to the specified value. Key and value strings MUST be stored as the provided character pointers. If the dictionary already has an entry for this name, the value is replaced and the old value is removed. If a callback was provided on dictionary creation, it SHALL be called with a NULL pointer for the key and the pointer of the previous value.

# 3 Memory Management

The majority of data structures returned by an implementation is newly created on the heap. All those structures need to be freed by a call to the according counterpart function (drmaa2\_\*\_free) by the application. This should be clearly indicated in the end-user documentation, otherwise memory leaks may occur.

The following functions are expected to return only pointers to existing data, which demands no subsequent freeing of the returned data:

• drmaa2\_dict\_get

- drmaa2\_list\_get
- drmaa2\_jsession\_wait\_any\_started
- drmaa2\_jsession\_wait\_any\_terminated

The following functions, when successfully executed, return newly allocated data. Their results must either be free directly, or indirectly be freeing the surrounding wrapper structure.

Implementations MAY register their matching default callback for the returned data structure:

- drmaa2\_get\_drms\_name
- drmaa2\_get\_drms\_version
- drmaa2\_describe\_attribute
- drmaa2\_dict\_create
- drmaa2\_dict\_list
- drmaa2\_get\_instance\_value
- drmaa2\_get\_jsession\_names
- drmaa2\_get\_rsession\_names
- drmaa2\_jarray\_get\_id
- drmaa2\_jarray\_get\_jobs
- drmaa2\_jarray\_get\_jtemplate
- drmaa2\_jarray\_get\_session\_name
- drmaa2\_j\_get\_id
- drmaa2\_j\_get\_info
- drmaa2\_j\_get\_get\_jt
- drmaa2\_j\_get\_session\_name
- drmaa2\_jinfo\_create
- drmaa2\_jinfo\_impl\_spec
- drmaa2\_jsession\_get\_contact
- drmaa2\_jsession\_get\_jarray
- drmaa2\_jsession\_get\_job\_categories
- drmaa2\_jsession\_get\_jobs
- drmaa2\_jsession\_get\_session\_name
- drmaa2\_jsession\_run\_bulk\_jobs
- drmaa2\_jsession\_run\_job
- drmaa2\_jtemplate\_create

- drmaa2\_jtemplate\_impl\_spec
- drmaa2\_lasterror\_text
- drmaa2\_list\_create
- drmaa2\_machineinfo\_impl\_spec
- drmaa2\_msession\_get\_all\_jobs
- drmaa2\_msession\_get\_all\_machines
- drmaa2\_msession\_get\_all\_queues
- drmaa2\_msession\_get\_all\_reservations
- drmaa2\_notification\_impl\_spec
- drmaa2\_open\_jsession
- drmaa2\_open\_msession
- drmaa2\_open\_rsession
- drmaa2\_queueinfo\_impl\_spec
- drmaa2\_rinfo\_impl\_spec
- drmaa2\_rtemplate\_impl\_spec

# 4 Implementation-specific Extensions

The DRMAA root specification allows the product-specific extension of the DRMAA API in a standardized way.

New methods added to a DRMAA implementation SHOULD follow the conventions from section 2.

New attributes SHOULD use a product-specific prefix for a clear separation of non-portable and portable parts of the API. The struct definitions in drmaa2.h SHALL remain unmodified in all cases. Therefore, these attributes are expected to only be accessible through drmaa2\_get\_instance\_value and drmaa2\_set\_instance\_value. Implementations can store their specific additional attributes behind the standardized implementationSpecific pointer in drmaa2\_jinfo\_s, drmaa2\_rinfo\_s, drmaa2\_slotinfo\_s, drmaa2\_ptemplate\_s, drmaa2\_rtemplate\_s, drmaa2\_notification\_s, drmaa2\_queueinfo\_s, drmaa2\_version\_s, and drmaa2\_machineinfo\_s.

# 5 Complete Header File

The following text shows the complete C header file for the DRMAAv2 application programming interface. DRMAA-compliant C libraries MUST declare all functions and data structures described here. Implementations MAY add custom parts in adherence to the extensibility principles of this specification and the root specification.

The source file is also available at http://www.drmaa.org.

# 6 Security Considerations

The DRMAA root specification [3] describes the behavioral aspects of a standard-compliant implementation. This includes also security aspects.

Software written in C language has well-known security attack vectors, especially with memory handling. Implementors MUST clarify in their documentation which kind of memory management is expected by the application. Implementations MUST also consider the possibility for multi-threaded applications performing re-entrant calls to the library. The root specification clarifies some of these scenarios.

## A Differences to GFD-R-P.198

The following changes were applied in the July 2015 revision of this document:

Issue #115, #104:

Section 3 was introduced to describe the rules of memory management from the application point of view.

Issue #59:

The numeric parameters of drmaa2\_jsession\_run\_bulk\_jobs are now const. The pos parameter of drmaa2\_list\_del ist now const. The pos parameter of drmaa2\_list\_get ist now const. This modification is backward-compatible.

Issue #57:

drmaa2\_limit needed to be removed, since (numeric) enumeration members cannot become keys in dictionaries. Instead, a set of according constants was introduced, as explained in the newly introduced Section 2.2. The text also explains how these constants must be initialized by the implementation code. This modification is not backward-compatible, since the original version was not implementable.

Issue #116:

drmaa2\_dict\_default\_callback and a set of default list callbacks were introduced. This modification is backward-compatible.

Issue #160, #162:

All struct definitions got an additional implementationSpecific member. It is intended to store the implementation-specific attributes, as now explained in Section 4. This modification is not backward-compatible, since the drmaa2.h header file changes. All relevant implementations are already updated.

Issue #255:

All enumerations got an additional UNSET value. The motivation is now explained in 1. drmaa2\_listtype was completed with numeric defaults, similar to the other enumerations. This modification is backward-compatible for the known implementations and their compilers.

Issue #113:

drmaa2\_get\_all\_machines() returns a list of drmaa2\_machineinfo\_s instances, which contains a pointer to a drmaa2\_version\_s struct. This demanded the addition of DRMA2\_UNSET\_VERSION. This modification is backward-compatible.

Issue #165:

The allocatedMachines attribute in drmaa2\_jinfo\_s has now the type drmaa2\_slotinfo\_list, in accordance to the root specification.

Issue #114:

For consistency reasons, the following renaming took place:

- drmaa2\_jarray\_get\_job\_template becomes drmaa2\_jarray\_get\_jtemplate
- drmaa2\_j\_get\_jt becomes drmaa2\_j\_get\_jtemplate

This modification is not backward-compatible, since the drmaa2.h header file changes. All relevant implementations are already updated.

Issue #63:

All numerical types are signed, in order to support -1 as numerical UNSET value. For this reason, the numerical parameters of drmaa2\_jsession\_run\_bulk\_jobs were changed to long long. This modification is not backward-compatible, since the drmaa2.h header file changes. All relevant implementations are already updated.

Issue #163:

The two new functions drmaa2\_j\_reap and drmaa2\_jarray\_reap were introduced, in accordance to the July 2015 errata of the root specification.

Issue #102:

The July 2015 root specification errata adds jobName to the JobInfo structure, which is now also reflected in drmaa2\_jinfo\_s. This modification is not backward-compatible, since the drmaa2.h header file changes. All relevant implementations are already updated.

Issue #287:

A new element for the PowerPC 64bit little-endian architecture (PPC64LE) was added to the drmaa2\_cpu enumeration. This modification is not backward-compatible, since the drmaa2.h header file changes. All relevant implementations are already updated.
